## Ongoing Programs

EVE continued to develop its programs with partners on infectious diseases, species-at-risk, youth-at-risk, climate change and peace, working in Africa and Canada's Indigenous communities. Due to limited resources, we completed our charitable objects during the year primarily by the use of volunteers. We continued developing a youth exchange between Indigenous communities in Canada, urban Canada and Africa, with a focus on species-at-risk, cultures-at-risk and infectious diseases. This is a similar program to the large exchanges EVE organized in 1990s, except now optimizing digital tools and social media. Increasing emphasis has been placed developing peace programs with the Burundian diaspora of Canada with several of the EVE youth from the 1990s leading volunteer efforts toward peace in the country's region. The Power Stat developed last year has created a platform to provide WIFI and surveillance to create peace corridors in challenging environments such as Burundi and eastern DRC. The platform is being used to engage local communities in addressing threats of war, poaching and disasters. The programs use the same technologies as in previous programs. Internet services are being developed to cover remote areas and use the surveillance technology to identify threats to cover remote areas and use the surveillance technology to identify threats in war zones, disaster areas and areas where people are parching or burning down forests.

## New Programs

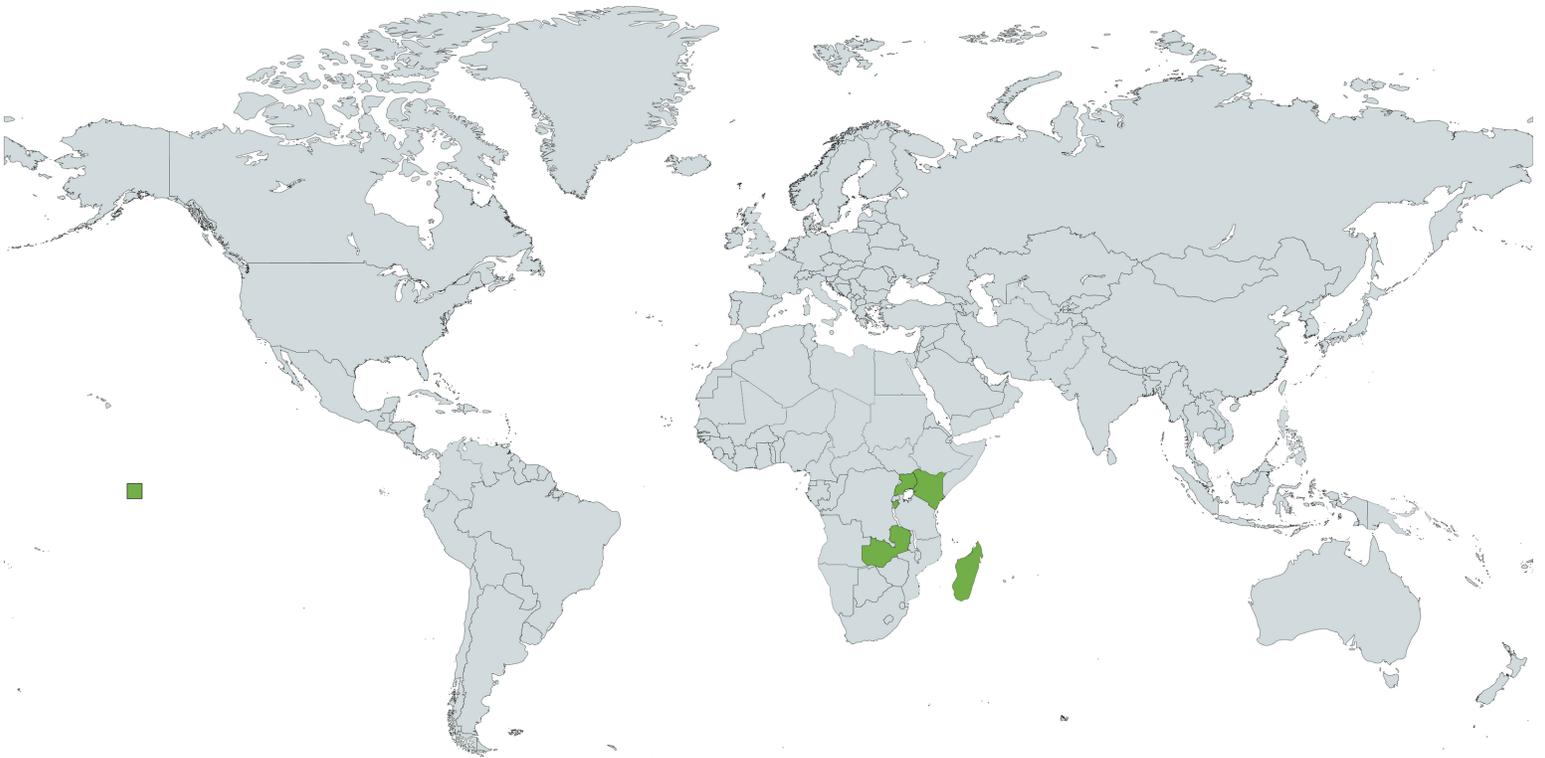

Inuit communities have emphasized the need to address the threat of youth suicide in their communities. While EVE has worked with First Nations in several parts of Canada who face high attempted suicide rates, the situation in Inuit communities is different. An exchange between African communities and Inuit communities is being developed around a theme of communities-at-risk working to help species-at-risk. Caribou and marine mammals, particularly whales, are the initial focus in Canada. Elephants, rhinos and gorillas are the initial focus in Africa. Training youth to work with Power Stats and artificial intelligence can create potent platforms for protecting species and creating jobs. As the world's environment changes, animals and humans are increasingly in conflict. Giving youth to work with advanced technologies gives them job skills. Giving youth the opportunity to work with other cultures gives them different perspectives on economic development, cultural development and self-esteem. Initial feedback suggests this could have positive impact on reducing suicide rates. More work needs to be done to develop these themes.
